

Electron Fly Tags:

how to apply them correctly

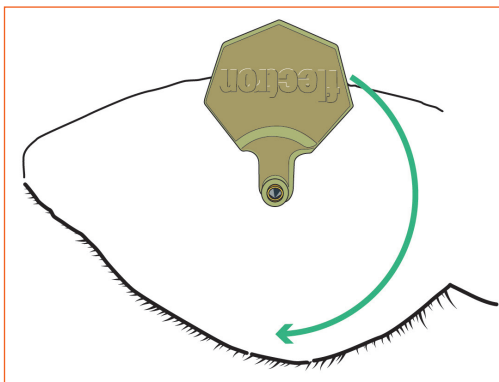

- 1 Restrain the head of the animal**
 - the use of a crush is ideal.
- 2 Always dip the loaded applicator** into disinfectant solution before each application.
 - any skin-compatible disinfectant may be used: this assists application, helps prevent spread of infection, aids hygiene and promotes healing.
- 3** Place the fly tag under the clip by depressing the lever.

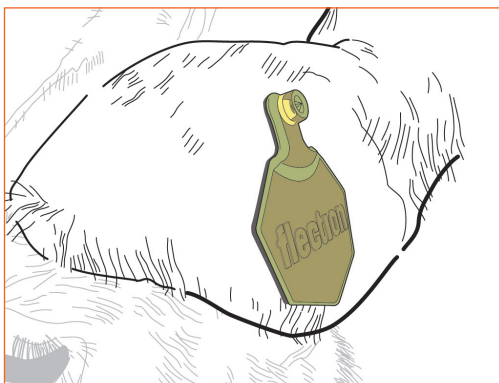

- 4 Ensure the smaller "male" stud is placed centrally**, in an area of firm tissue between the second and third rib on the *inside* of the ear, so that the larger "female" part is on the back of the ear.

- Thick sections of the ear should be avoided, as should blood vessels.
- When applying, depress the applicator fully and sharply so that a **'click'** is heard – this ensures correct fixing.
- The tag should swing freely on the ear.

It is vital the female part is in contact with the ear as this is how the active is spread around the animal.

- 5 Check!** After fixing, pull the stud and tag firmly apart, as far as possible – a correctly fixed tag will hold firm.

Do not push the tag and stud back together, as this can lead to compression of the ear tissue.

Whole body protection is provided within 24-48 hours of tagging.
