

Autumn Parasite Control

CYDECTIN TriclaMox Drench

MEETING THE FLUKE & WORM CHALLENGE

zoetis

What you need to know about fluke:

Autumn is the high risk period for acute fluke, which is caused by immature fluke (both early and late).

Immature fluke migrate through the liver tissue causing the damage that can lead to a loss in productivity and sudden death in lambs.

The potential cost of fluke:

** Sheep Health and Welfare Group Report (2016)*

CYDECTIN TriclaMox Sheep Drench

- **A combination fluke & worm drench**
- **Manages mixed burdens in one treatment**
- **Contains moxidectin**
 - A potent formulation providing the most effective* ML efficacy against resistant worms
 - **Provides up to 35 days persistent worm control**
- **Contains triclabendazole**
 - **Effective against all stages of fluke**
 - Early immature, Late immature, Adult
- **Can be used for up to 6 months once broached**
 - Allows flexibility of flock treatment which supports a selective treatment strategy
- **Meat withhold 31 days**

*Ranjan, S. et. al.
Vet Parasitol. 2002

The importance of activity against all stages of fluke

- ▶ Several of the available flukicide compounds have good activity against the adult stage of the liver fluke. However, they are not sufficiently effective against the pathogenic early immature stages, which migrate through the liver parenchyma causing severe damage.
- ▶ Triclabendazole has excellent activity against both early and late immature fluke as well as adult stages.

Ensure you have the worm cover you require

- ▶ The benefit of moxidectin is the **35 days persistency** for worm control means you are less likely to require re-treatment for worms in late autumn.
- ▶ Moxidectin has a **potent formulation** providing the most effective ML efficacy against resistant worms.
